## **GENERALITIES**

## Warnings

In this document, safety instructions are symbolized as follows:

**DANGER!** NON-OBSERVANCE OF THE PROCEDURE DESCRIBED OR LACK OF CARE OR ATTENTION, RISK CAUSING SERIOUS INJURY OR EVEN DEATH.

**WARNING!** Any different or inappropriate working method risks causing damage to the product.

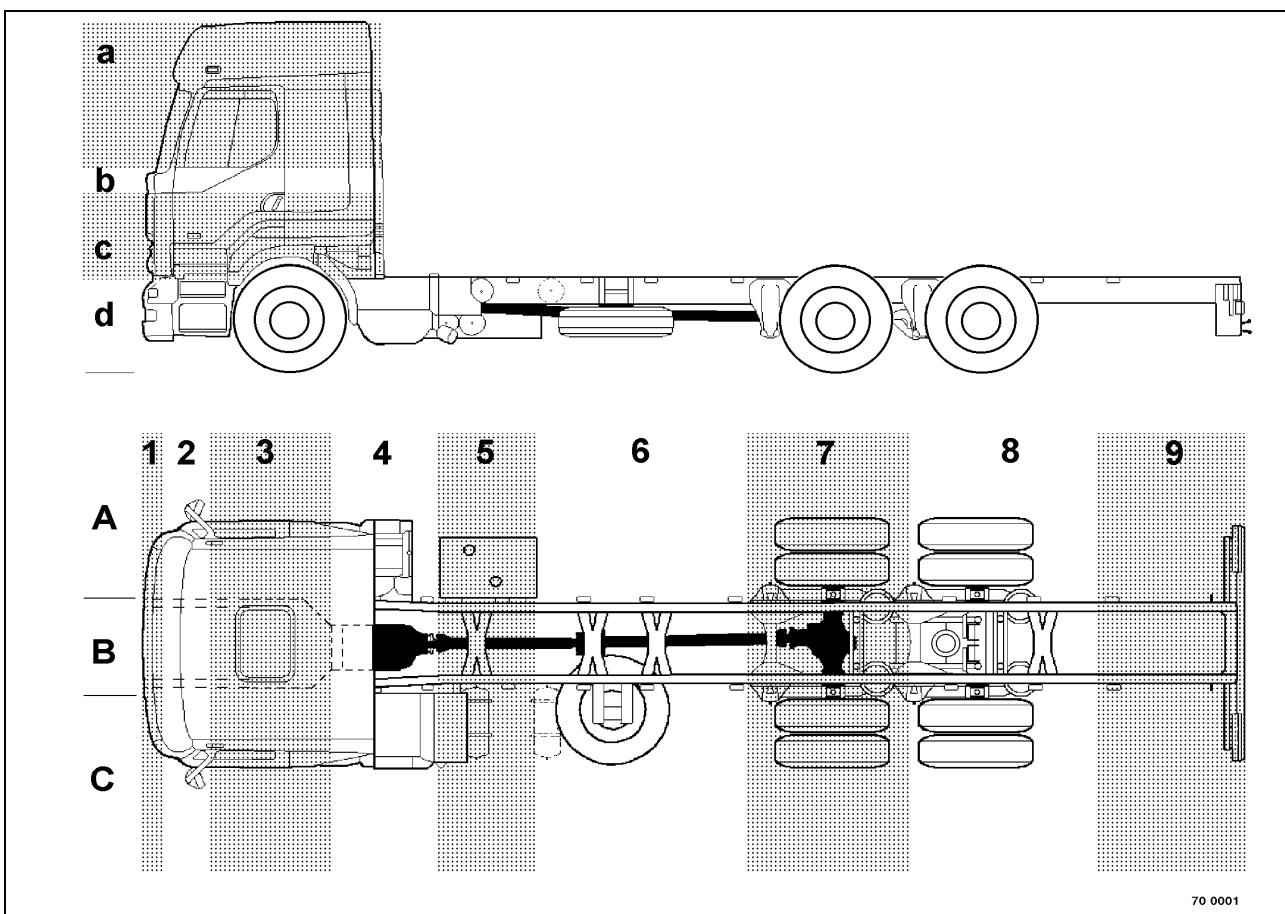

**NOTE!** Draws attention to particular or important points of the method.

**Comply without fail with the regulations in force relative to the recovery and treatment of used parts and waste.**

## Vehicle voluminal breakdown

The vehicle is broken down into several zones each designated by an item number.

Heightwise breakdown

Reserved for the bodywork, 4 zones designated by a small letter

Widthwise breakdown

3 zones designated by a capital letter

A: RH side and RH sidemember

B: Central part

C: LH side and LH sidemember

Lengthwise breakdown:

9 zones designated by a figure.

Zone 7 is specific for **6x4 - 6x6**.

Zone 1 indicates:

- on the chassis, the bumper and the components it supports.

- on the cab, the front end components accessible through the grille

Example:

A1: bumper RH section (headlamps, ...)

C3: LH front wheel (ABS sensor, ...)

C2b: dashboard

A3c: passenger's seat

## How to read the diagrams

### Definition of an illustration

The diagram consists of several plates

The plates are defined in the bottom right-hand corner by:

- A six-figure number, which is the reference number.
- A letter, which is the revision index of the illustration. This letter is to be found on the same line as the reference number.
- A three-figure number, which defines the folio number.

A diagram plate is broken down into **5** zones in the vertical direction.

These zones are identified by letters ranging from **A** to **E**.

### Definitions of symbols used in a diagram

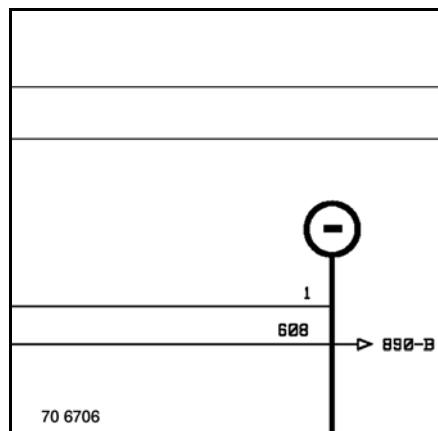

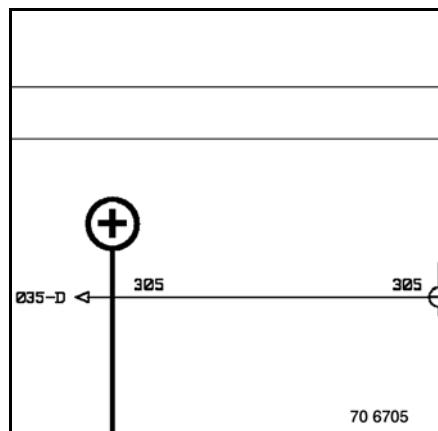

#### Cross-references

The folio coordinates to be found on the left always refer back to a preceding page.

The folio coordinates to be found on the right always refer forward to a following page.

The cross-reference is defined by:

- a 3-figure number that gives information on the order number of the destination folio,
- a letter that gives information on the zone in which the cross-reference is to be found.

### Appliances

Each appliance shown in the diagram is identified by an after-sales code number.

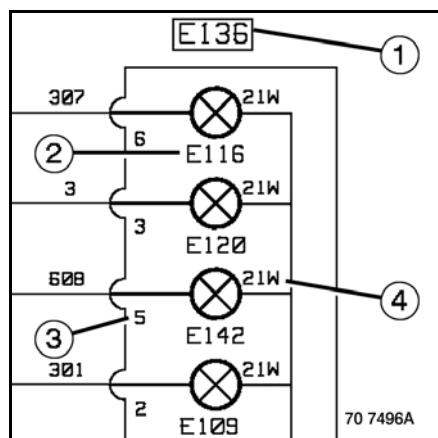

If the after-sales code number is framed (item **(1)** of the illustration opposite), it indicates a single appliance or an assembly comprising several functions.

If the after-sales code number is not framed (item **(2)** of the illustration opposite), it indicates a single appliance. It is then to be found inside the symbol.

Underneath each appliance, we define, wherever possible, the colour and the number of ways of the connector with which it is associated (item **(3)** of the illustration opposite).

All the terminals of each appliance are defined by a numerical or alphanumerical code number, if necessary (item **(4)** of the illustration opposite).

For certain appliances, we define, wherever possible, the power with which it is associated (item **(5)** of the illustration opposite).

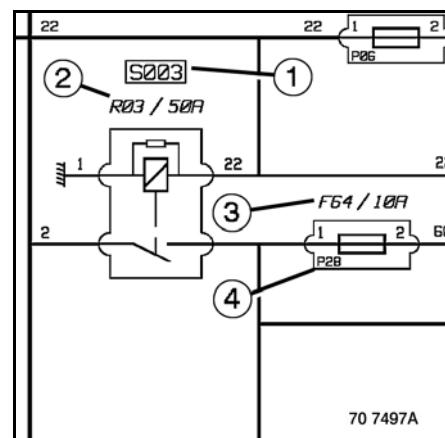

### Fuses and relays

Relays are designated by an after-sales code number (item (1) of the illustration opposite).

They are also designated by an alphanumerical code number and by the value of the rated current capable of crossing them (item (2) of the illustration opposite).

Fuses are merely designated by an alphanumerical code number and by the value of the rated current capable of crossing them (3) of the illustration opposite).

The position of a fuse in the electrical distribution box is designated by an alphanumerical code number (item (4) of the illustration opposite).

### Polarities

Polarities are identified by a numerical code number.

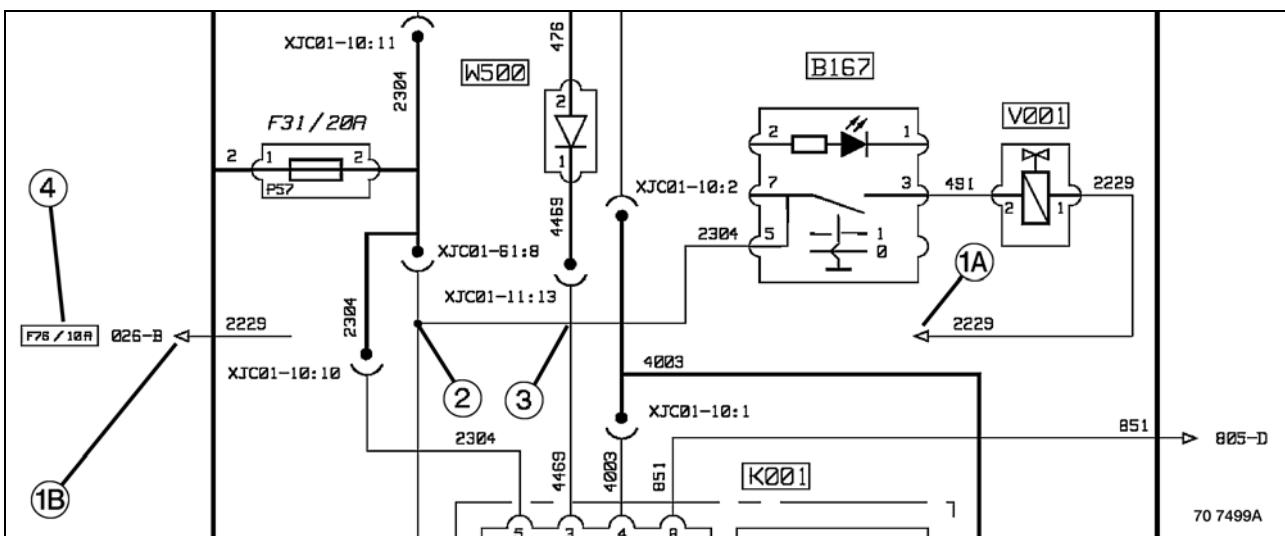

For each function, there is one same, single code number.

Example:

**2** = battery "positive" direct current power supply.

**1** = earth.

### Graphic conventions

A folio cross-reference can consist of two sections.

The first in a zone of the diagram (item (1A) of the illustration above).

The second to the right or left of the zone of the diagram according to its destination (item (1B) of the illustration above).

In all cases, both sections are always on the same line.

This principle is applied whenever it makes it possible to avoid polarity crossovers that may prejudice clear legibility of the diagram.

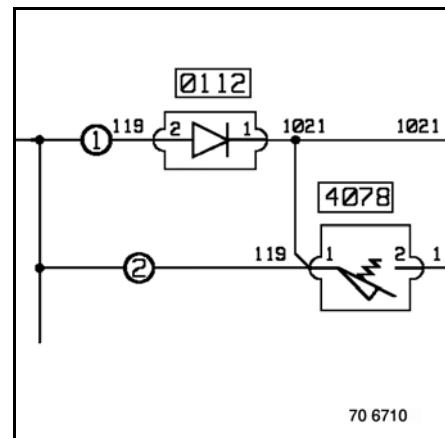

If an intersection is not reinforced by a connection point, the polarities cross over and are distinct (3).

If an intersection is reinforced by a connection point, we have the same level of information on the wires (same potential).

It is possible for extra connection points to be applied to the diagram for legibility reasons (item (2) of the illustration above).

When a folio cross-reference points directly to a fuse, that fuse is identified (4).

It is possible for a function to have several technical responses. In this case, we call upon the notion of "variant" or "option". This notion is represented by a figure inside a circle. This symbol is placed on the polarity in question. An explanation to be found on the page opposite the diagram describes the possible options. If a folio represents several assemblies, it goes without saying that a vehicle can have only one single option.

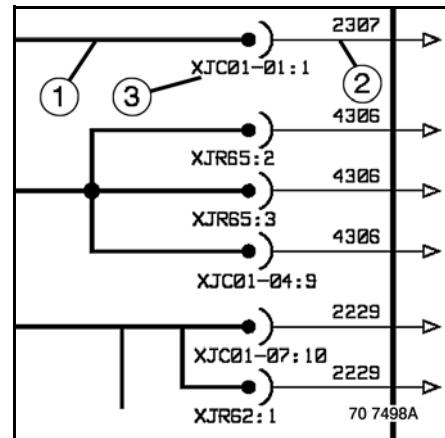

The thick line (1) represents a part of the electrical circuit located in the electrical distribution box.

The fine line (2) represents a part of the electrical circuit located outside the electrical distribution box.

The item (3) represents a connector terminal located in the electrical distribution box.

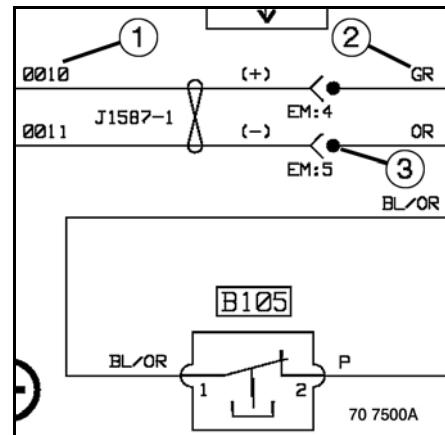

Example with alphanumeric code number **XSC01-01:1**:

- **XSC01-01**: connector number;
- **1**: connector terminal number.

In the case of wiring harnesses connected to the engine, we have on the one hand an alphanumeric item number (1) and on the other hand a colour identification (2).

**EM:4** (3) indicates that the connection is made on the connector "EM" terminal "4".

## Wiring harnesses

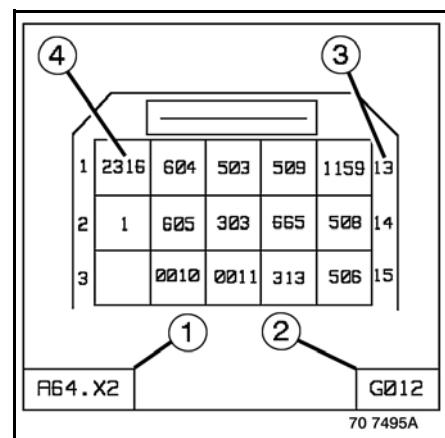

Presentation of connectors:

(1): connector number

(2): code number of appliance to which it is connected

(3): terminal number

(4): number of the wire in the terminal

## Colour code applicable to connectors and wires

Each connector features a foolproofing system consisting of a mechanical device and a colour code.

Some wiring harnesses, connected directly to a sub-assembly common to several users, have their polarities identified by a colour code only.

The list below shows the equivalence between an alphabetical code and the colour of the wires or connectors making up a wiring harness.

Colour code	Component colour
SB	Black
BN	Brown
R	Red
OR	Orange
Y	Yellow
GN	Green
BL	Blue
LBL	Light blue
VO	Purple
LVO	Violet
GR	Grey
W	White
P	Pink
NL	Colourless

## Electrical distribution

The cab electrical distribution box contains the majority of the fuses and relays necessary for operation of the vehicle.

The distribution box is symbolized in the electrical diagram by links drawn with bold lines.

The terminals of the distribution box are also represented in the schematic diagram.

Each face of the electrical distribution box is detailed in the "Electrical distribution unit" chapter.

The chassis-cab connection box enables the information to be found inside the cab to cross the bulkhead and be routed to the outside and vice versa.

Each connector of the chassis-cab connection box is detailed in the "Electrical distribution unit" chapter.

**Precautions to be taken when making electrical measurement readings****Protection of appliances**

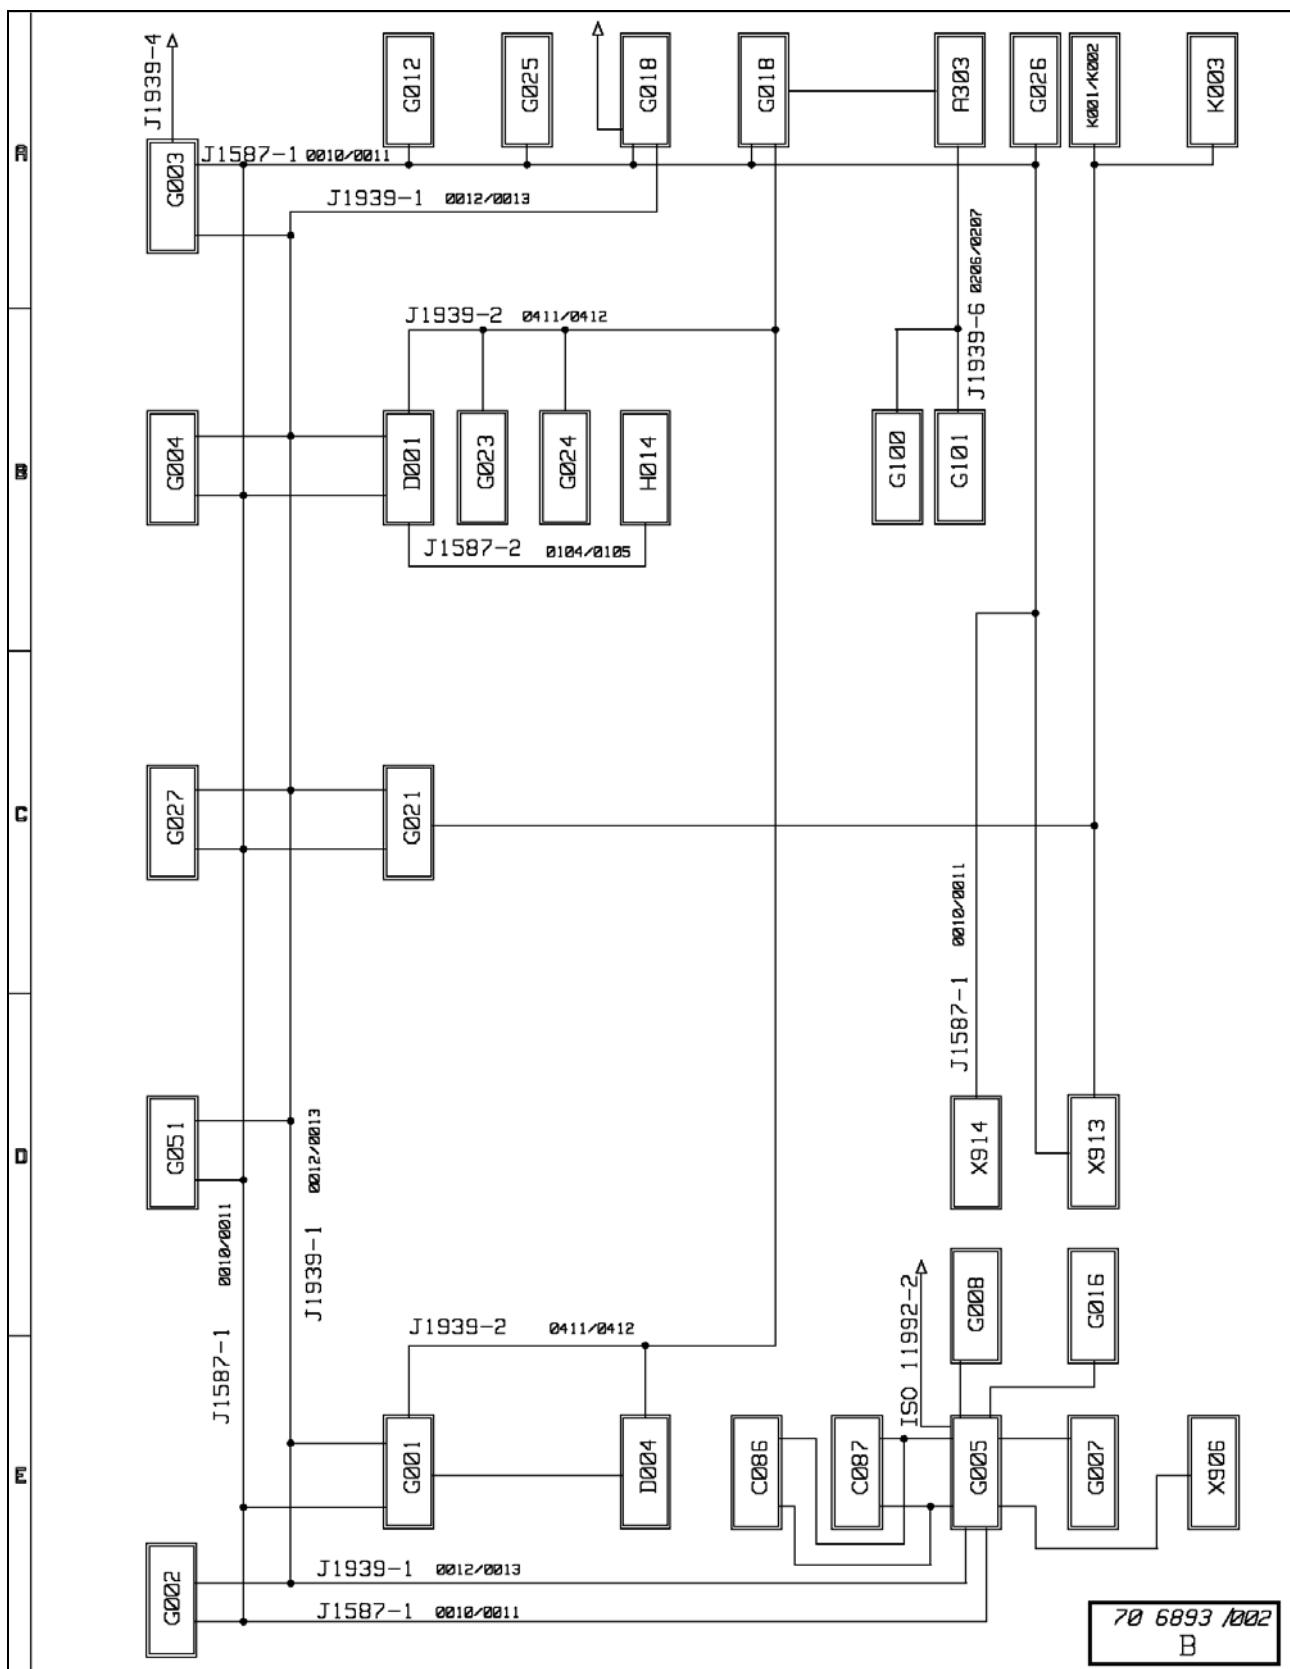

Bearing in mind the presence of numerous electronic appliances, the use of a test lamp is to be avoided. Preferably use a needle or digital type multi-meter.

It is forbidden to apply voltage to the terminals of electronic appliances or you may cause irreparable damage to the hardware. Consequently, no line continuity measurement should be made on the wires without having previously disconnected the appliances from the lines concerned.

## **AVAILABLE POWER SUPPLIES**

## Available power supplies

All electrical connections must be made, without fail, to the available power supplies made available by RENAULT TRUCKS.

It is strictly forbidden to make an electrical tapping on any of the different wiring harnesses on the vehicle.

It is compulsory to use and adapt connectors and wiring harnesses officially approved and distributed by RENAULT TRUCKS.

Cable sections should be adapted to the required use. RENAULT TRUCKS recommends a value of **7 Amps per mm<sup>2</sup>** for calculating the cross-section of the conductor.

Make use of the circuit protections recommended by RENAULT TRUCKS.

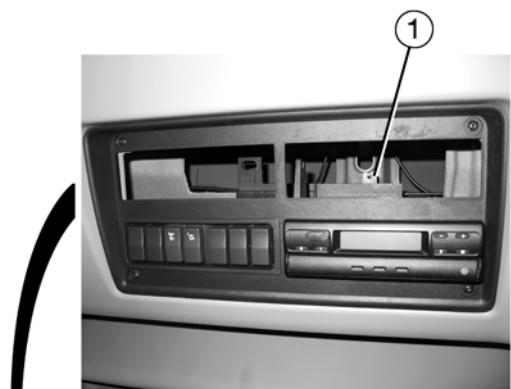

IT IS FORBIDDEN TO CHANGE FUSE RATINGS.

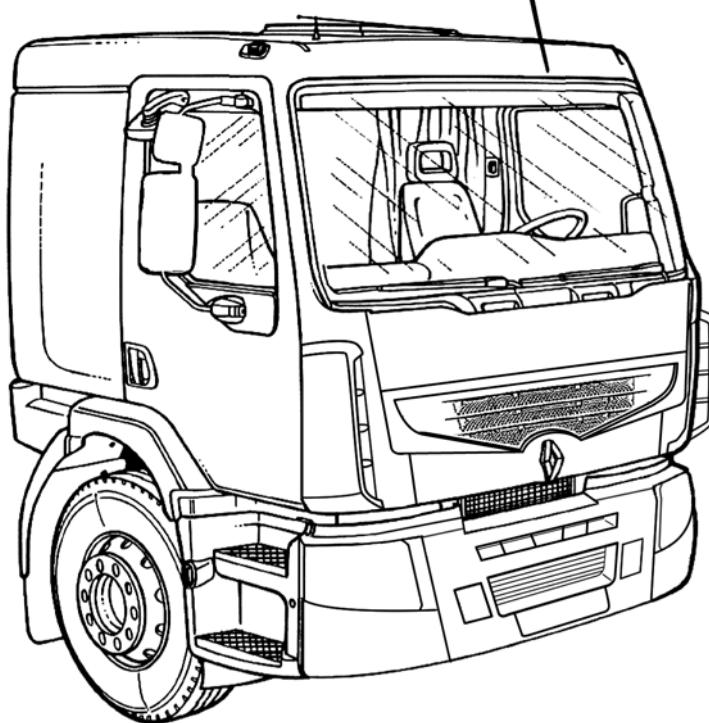

There is a high risk of irreparable damage being caused to the ECUs if electrical loads are applied without integrated protection.

**Available power supplies**

60 3611A

70 7525A

## Available power supplies

## **DEALER NETWORK AND CUSTOMER FOLLOW-UP**

## **Customer services liaison**

Our ambition is to give you access - you who work on diagnostics, repairs and maintenance (using documents issued by the After-Sales Department) - to information that is as exact and accurate as possible.

By giving us our opinion, by informing us on divergences found between what is written in this manual and what exists on the vehicle or major unit concerned, by letting us have your suggestions and sharing your experience with us, you will contribute in helping us devise top quality technical documentation.

You can write down your remarks and suggestions on a copy of this information sheet or on plain paper and send them by fax or by mail to the address below.

**Address:**

**After-Sales Technical Service Department  
API: TER B50 1 02  
99, Route de Lyon  
69806 - SAINT PRIEST Cedex
